7. Integrating Event Registration Form with Zoho CRM via Connections and APIs

Aim

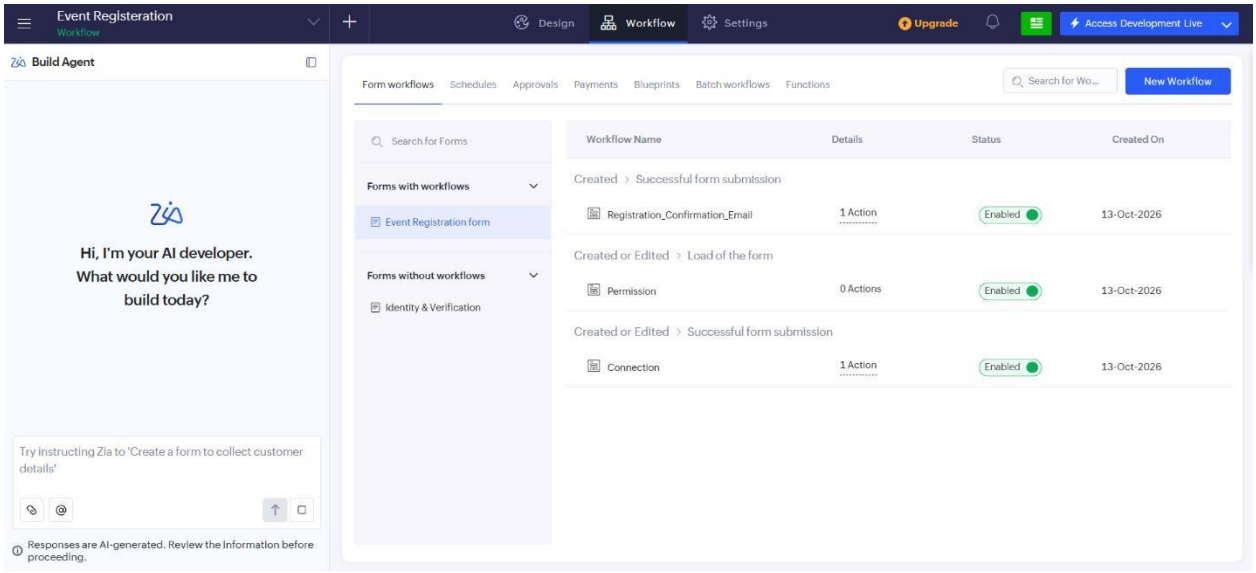

To design and integrate the Event Registration Form application in Zoho Creator with Zoho CRM using an authenticated connection and automated workflow actions, enabling participant data to be synchronized after successful registration.

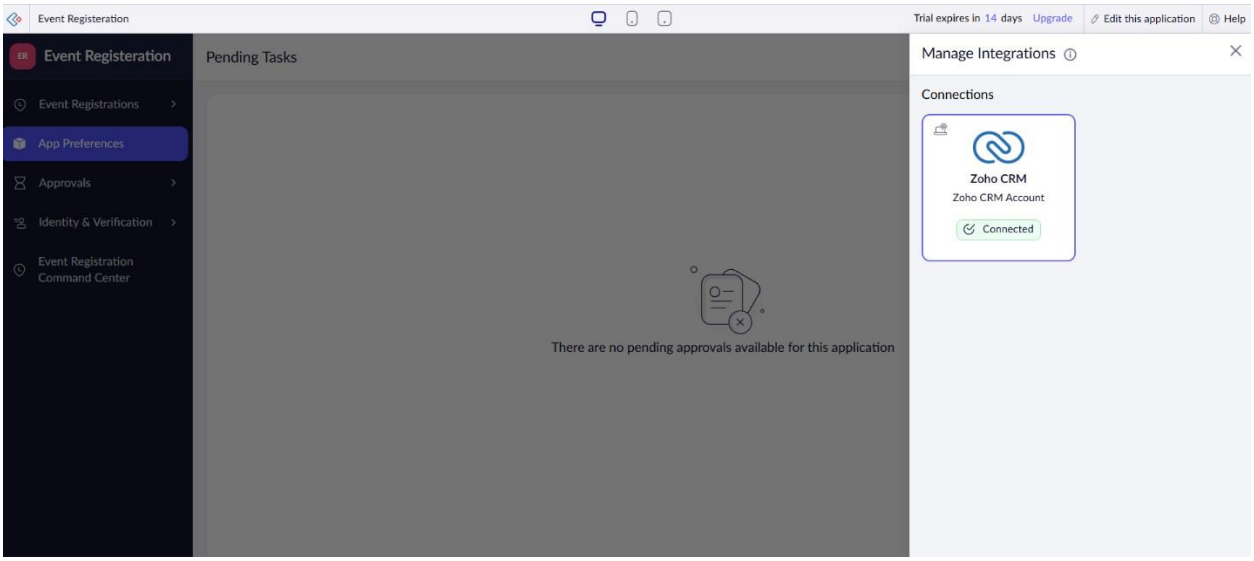

Procedure

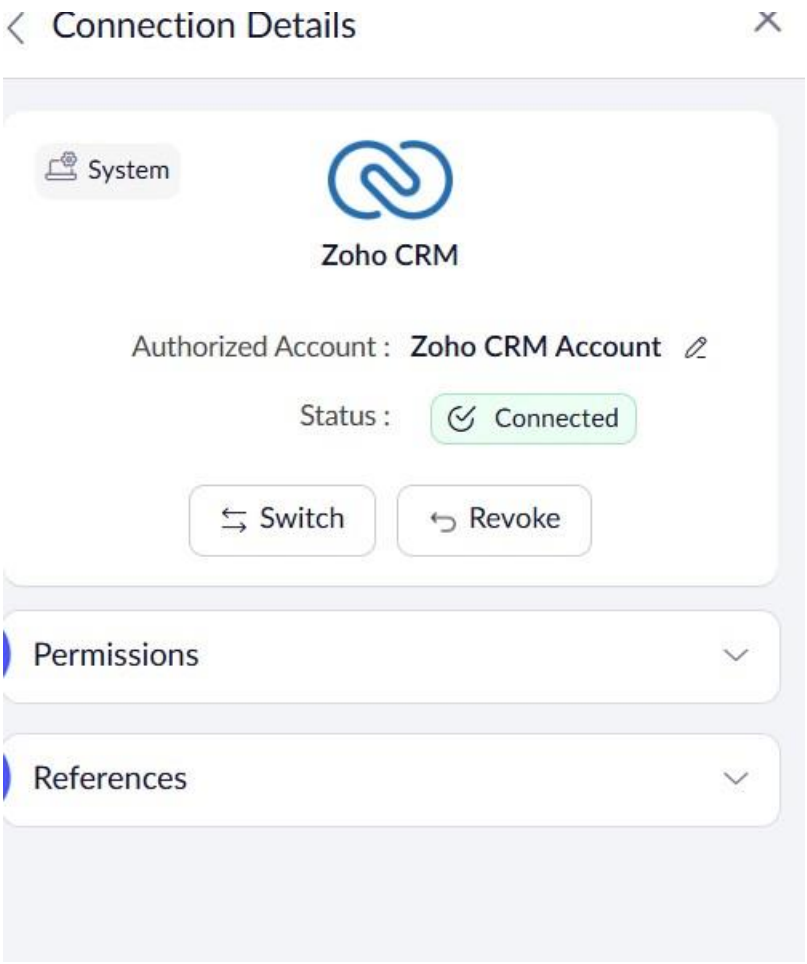

1. Application Setup: Log into Zoho Creator and create or open an application titled “Event Registration Form”.
2. Form Design: Create the Event_Registration_Form with participant details such as Participant Name, Email, Phone Number, Institution/Organization, Event Track, Participant Type, Preferred Session Date, and Payment Status.
3. Integration & Authentication: Navigate to App Settings or Manage Integrations in Zoho Creator. Select Zoho CRM and establish a secure OAuth connection. Verify that the connection status displays Connected.
4. Workflow Configuration: Open the Workflow tab, select Event_Registration_Form, and create a workflow triggered when a registration record is successfully created.

5. Action Mapping: Add a Zoho CRM integration action and map participant fields to the appropriate CRM module fields, such as Leads or Contacts. Enable the workflow so registration details are sent to Zoho CRM after submission.

Result

The Event Registration Form was designed for integration with Zoho CRM. When a participant submits the registration form, the configured workflow can send the participant details to the mapped CRM module, helping the organizing committee maintain synchronized registration and contact records.
